B2B GTM Audit Checklist

A 16-area audit of the go-to-market system, scored 0-3, with an action framework for the next 30, 60 and 90 days.

Author	Subhasish Adhikary
Format	Self-scored audit, 16 areas
Scoring	0-3 per question, 0-48 total
Companion	tools/gtm-diagnostic

Scoring and priorities

How to run the audit

This audit scores the system, not the campaign. Work through all 16 areas before acting on any single score: the point is to see which part of the machine is limiting the others, then fix that first.

Score every question 0-3. A 0 is not a judgement about the team; it is a statement that the capability does not exist in a repeatable form yet.

Score	Definition	What it implies
0	Absent. Nobody owns it; the process changes with each person.	Foundational gap. Fix before optimising downstream.
1	Ad hoc. It happens, but undocumented and inconsistent.	Fragile. Write the standard down first.
2	Documented and followed, with gaps at the edges.	Working. Tighten measurement and edge cases.
3	Instrumented, owned, reviewed on a cadence.	Leverage. Tune, do not rebuild.

Rule of thumb: any area scoring 0 or 1 on more than half its questions is upstream of the numbers you are trying to move. Fix that area first — dashboards will not.

Audit areas

Sixteen areas, four questions each. The "good looks like" and "warning signs" columns are the fastest way to spot where your answer would be optimistic.

Ideal customer profile

Customers actually match the stated ICP?

Is there an explicit disqualification list, not just an inclusion list?

Score (0-3)	Good looks like	Warning signs
	A one-page ICP with firmographic, technographic and trigger criteria; a named list of good-fit and bad-fit accounts; a quarterly review against closed-won data.	ICP drift: the ICP document has not changed while the closed-won mix has. If your best deals come from accounts your ICP labels low-priority, the document is stale, not the deals.

Segmentation

Does each segment have a coverage promise?

Can you size each segment in accounts, not in percentages?

Score (0-3)	Good looks like	Warning signs
	Two to four segments with distinct buying behaviour; each with an owner, a coverage cadence and a measurable size.	Segments that exist only in slides; three segments that need three different value propositions but share one messaging document.

Positioning

Can a competitor claim the same sentence?

Does the positioning survive contact with a pricing page and a sales call?

Score (0-3)	Good looks like	Warning signs
	One paragraph any team member can deliver, naming the category, the buyer, the alternative and the differentiated outcome.	Positioning that is a list of adjectives; positioning that sales quietly ignores and replaces with their own pitch.

Messaging architecture

Can a buyer verify?

Is the messaging consistent across ads, site, outbound, sales deck and onboarding?

Score (0-3)	Good looks like	Warning signs
	A message matrix: persona x stage x proof. Sales and marketing quote the same lines.	Marketing's message never reaching the sales call; proof points that are assertions rather than evidence.

Buyer journey

Can you track by internal lead status?

Do you know the two most common paths from first touch to closed-won?

Score (0-3)	Good looks like	Warning signs
	A journey map defined by observable buyer behaviour, with entry and exit criteria at each hand-off.	A journey drawn from the CRM's stages rather than the buyer's actual path; stages nobody can define without arguing.

GTM motion

assembly line or pods), and is that choice written down?

Is the motion affordable at current ACV and sales-cycle length?

Score (0-3)	Good looks like	Warning signs
	One named motion per segment, with the team structure and economics to support it.	A pipeline-driven motion funded by a marketing budget; a product-led motion with a quota-carrying team that does not touch the product funnel.

Demand generation

individual leads?

Is demand measured in pipeline and revenue, not in leads?

Score (0-3)	Good looks like	Warning signs
	A funding split between creation and capture, with pipeline attribution that survives scrutiny.	Reporting leads while sales reports pipeline; every programme claiming the same closed-won deal.

Acquisition channels

sales cycle and team capacity?

Have you deliberately stopped the channels that cannot be justified this year?

Score (0-3)	Good looks like	Warning signs
	A short channel portfolio with explicit economics per channel and a documented reason for every channel you do not run.	Running eleven channels because competitors do; no channel with enough investment to work.

Sales and marketing alignment

and signal data?

Is there a service-level agreement in both directions with a measured response?

Score (0-3)	Good looks like	Warning signs
	One definition, one data set, two-way service levels, a standing review.	Marketing defends lead volume, sales defends conversion; the argument replaces the diagnosis.

Lead lifecycle

sum time-in-stage?

Are recycled or disqualified leads reintroduced deliberately?

Score (0-3)	Good looks like	Warning signs
	Lifecycle stages with behavioural entry/exit rules, owners, and stage-to-stage conversion reporting.	Leads that stall invisibly between stages; a "nurture" bucket that is really a graveyard.

CRM and data hygiene

or orphaned records?

Are duplicate rates and field completeness measured?

Score (0-3)	Good looks like	Warning signs
	Enforced required fields, exclusive account ownership, measured hygiene, pipeline that reconciles with finance.	Forecast built outside the CRM; ownership split across several owners so nobody is accountable.

Marketing automation

tate rather than time alone?

Is there a documented throttle so no contact receives conflicting messages?

Score (0-3)	Good looks like	Warning signs
	Automation that is event-driven, throttled across teams, with auditable consent and suppression.	Six teams sending independent sequences; a contact receiving three offers in one week.

Attribution

r only to report?

Are self-reported attribution answers captured on the forms you control?

Score (0-3)	Good looks like	Warning signs
	Two complementary views: a multi-touch model for trend, self-reported answers for ground truth — plus documented limits.	Single-touch credit to the last click; a channel winning the model while losing the customers.

Reporting and cadence

ner?

Does the report distinguish leading indicators from lagging ones?

Score (0-3)	Good looks like	Warning signs
	One page, defined metrics, owned numbers, a standing review where decisions are logged.	Metric definitions that change with the audience; reporting that describes rather than decides.

GTM stack and integrations

contacts and events?

Can you name which integration failure would stop the business tomorrow?

Score (0-3)	Good looks like	Warning signs
	A lean stack where each tool has an owner, a documented use case and a monitored integration.	Overlapping tools for the same job; enrichment, routing and reporting each with their own copy of the truth.

AI and automation opportunities

ver an AI output reaches a customer?

Are AI-assisted outputs measured against the baseline they replaced?

Score (0-3)	Good looks like	Warning signs
-------------	-----------------	---------------

AI doing bounded, measurable work with review checkpoints and a data policy.

Agents generating outbound at volume with no review; no measurement of whether quality held.

Scoring and priorities

Add the 64 scores (16 areas x 4 questions). The band tells you what class of work you are doing this quarter.

Total	Band	What to do next
0-16	Fragmented	Stop optimising channels. Rebuild the foundations: ICP, one owner per account, CRM hygiene, one qualification definition.
17-32	Emerging	The system runs but is inconsistent. Document the standards, instrument the funnel stages, close the lifecycle gaps.
33-48	Structured	The system is repeatable. Shift from building to measuring: attribution you trust, channel economics, coverage promises.
49-64	Systemic	Use the system as leverage: automate the repeatable, apply AI where the data is clean, re-audit quarterly.

Then prioritise the gaps with two questions only: how much does this block pipeline, and how long until it works?

Priority	Profile	Typical items	Window
P1	High impact, fast	Routing and response time, required fields, stage definitions, one owner per account	30 days
P2	High impact, slow	Positioning refresh, channel economics, attribution rebuild, enrichment layer	60 days
P3	Low impact, fast	Report consolidation, naming conventions, suppression rules	30 days
P4	Low impact, slow	Legacy tool consolidation, historical data migration	90 days or defer

A useful audit ends with fewer initiatives, not more. If the action list is longer than four items per window, it is a wish list.

Companion resources on the site: the GTM Diagnostic tool for a scored assessment, the Budget Lab for allocation against the gaps you find, the Automation Planner for lifecycle work, and the GTM Stack Builder for the tooling layer.
