

LEAD MAGNET

Marketing Automation Maturity Assessment

A 15-dimension self-assessment across five maturity levels, with scoring, interpretation and a priority matrix.

Author	Subhasish Adhikary
Format	Self-assessment, 15 dimensions
Scoring	1-5 per dimension, weighted
Companion	tools/automation-planner

Contents

How to score

The fifteen dimensions

Interpretation

How to score

Fifteen dimensions, each scored 1-5 against a written rubric. Score the capability you can evidence this month, not the one you intend to build. The result is a profile — the pattern of low and high dimensions matters more than the total.

Level	Name	Definition
1	Ad hoc	Manual, undocumented, inconsistent. Depends on individuals.
2	Basic	Documented and repeatable for the common cases. Gaps at the edges.
3	Structured	Standardised across teams, with owners and defined hand-offs.
4	Integrated	Connected end to end: systems share state, decisions are data-driven.
5	Intelligent	Adaptive where evidence supports it, measured, with human review where it matters.

Weighting: the four foundation dimensions (data, CRM, lifecycle management, lead capture) count double. They gate everything above them. Maximum weighted score: 19 dimensions-equivalent x 5 = 95; divide your total by 95 for a percentage.

The fifteen dimensions

Each rubric is written so that adjacent levels are distinguishable in practice. If you cannot evidence a level with a specific example, score the level below.

Data foundation (weight x2 - foundation)

Level 1	Fields created ad hoc; completeness unknown.
Level 2	Required fields defined on key objects; completeness measured sometimes.
Level 3	Completeness and duplicate rates measured on a cadence, with targets.
Level 4	Data quality enforced at the point of entry; lineage traceable to source.
Level 5	Quality monitored automatically, with alerting and documented remediation.

CRM as system of record (weight x2 - foundation)

Level 1	Used for contacts; pipeline lives elsewhere.
Level 2	Pipeline tracked in the CRM; ownership sometimes ambiguous.
Level 3	Exclusive account ownership enforced; stage definitions agreed.
Level 4	Forecast reconciles with finance; hygiene measured and owned.
Level 5	CRM drives routing and prioritisation automatically, with audit trail.

Lifecycle management (weight x2 - foundation)

Level 1	No agreed stages; statuses vary by team.
Level 2	Stages defined; transitions partly manual.
Level 3	Behavioural entry and exit criteria per stage, with owners.
Level 4	Stage-to-stage conversion and velocity reported and acted on.
Level 5	Lifecycle state drives channel behaviour automatically, with suppression honoured.

Lead capture (weight x2 - foundation)

Level 1	Forms across the site with no shared standard.
Level 2	Standard forms and a defined required set.
Level 3	Capture enriched and routed at create time.
Level 4	Capture strategy varies by intent and content, with experiment history.
Level 5	Capture adapts to returning visitors and account context, measured against baseline.

Enrichment

Level 1	Manual lookups when someone remembers.
Level 2	Enrichment runs on create for some sources.
Level 3	Enrichment standard on all sources, with refresh schedule.
Level 4	Enrichment fields mapped explicitly to routing and tiering needs.

Level 5	Enrichment quality scored; bad records flagged and replaced automatically.
----------------	--

Lead scoring

Level 1	No scoring, or scoring nobody trusts.
Level 2	Simple demographic and activity scores.
Level 3	Behavioural and fit scores separated, with thresholds agreed with sales.
Level 4	Scoring calibrated against closed-won, reviewed quarterly.
Level 5	Model recalibrated automatically on outcome data, with drift monitoring.

Routing and response

Level 1	Leads land in a shared queue.
Level 2	Round-robin routing, no response standard.
Level 3	Account-based routing with a named fallback owner.
Level 4	Response-time standard measured and reported per owner.
Level 5	Routing accounts for capacity and presence, with automatic escalation.

Nurturing

Level 1	Occasional batches to a list.
Level 2	Static sequences by persona.
Level 3	Behaviour-triggered nurture with stage awareness.
Level 4	Content and cadence tested per segment, with suppression rules.
Level 5	Cadence and content adapt per contact from observed response, within guardrails.

Automation architecture

Level 1	Disconnected workflows built per campaign.
Level 2	Shared workflows with naming and documentation.
Level 3	Reusable components with error handling and audit logging.
Level 4	Workflows versioned, tested in staging, with monitoring.
Level 5	Workflow selection is data-driven; failures self-heal or escalate.

Campaign operations

Level 1	Launch process is informal.
Level 2	Brief, checklist and QA exist.
Level 3	Standard launch process with owners and timelines.

Level 4	Capacity planned against a calendar; post-launch reviews are routine.
Level 5	Planning automated from pipeline targets; performance feeds next cycle.

Reporting

Level 1	Reports built on request.
Level 2	Standard reports exist for common questions.
Level 3	One page answers volume, quality and cost, with owned definitions.
Level 4	Leading and lagging indicators separated and reviewed on cadence.
Level 5	Anomaly detection surfaces issues before the review.

Attribution

Level 1	No attribution, or last-click only.
Level 2	Channel reporting with known limitations.
Level 3	Multi-touch model plus self-reported answers on owned forms.
Level 4	Attribution informs budget decisions and is documented with its limits.
Level 5	Models are validated against incrementality tests where feasible.

Integrations

Level 1	Manual exports and imports.
Level 2	Point-to-point integrations, undocumented.
Level 3	Central integration layer with error alerting.
Level 4	Contracts and schemas versioned; failure modes documented.
Level 5	Integrations monitored with automatic retry and reconciliation.

AI and agents

Level 1	No AI in production workflows.
Level 2	Individual use of general tools, ungoverned.
Level 3	Bounded AI tasks with review checkpoints.
Level 4	AI output measured against the baseline it replaced.
Level 5	AI applies where data is clean, with policy, monitoring and rollback.

Governance

Level 1	No documentation; knowledge is personal.
Level 2	Key processes documented in one place.

Level 3	Ownership and change control defined for core systems.
Level 4	Regular review of access, consent, and data policy.
Level 5	Governance is measured, automated where possible, and audited.

Interpretation

Divide your weighted total by 95 to get a percentage, then read the band. The profile underneath the number decides what to do: two similar totals can require completely different work.

Score	Band	Characteristic	Next move
0-35%	Ad hoc	Depends on individuals; results vary with who is on leave.	Fix the four foundation dimensions before automating anything.
36-55%	Basic	Common cases work; edges fail quietly.	Instrument the lifecycle and routing; make response time visible.
56-75%	Structured	Repeatable across teams; measurement exists.	Tighten calibration: scoring against outcomes, attribution you trust.
76-90%	Integrated	Systems share state; decisions are data-driven.	Orchestrate across channels; test incrementality; plan capacity.
91-100%	Intelligent	Adaptive with governance.	Guard against drift: monitor targets, re-baseline, review quarterly.

Profiles that repeat

Profile	Pattern	What it usually means
The Automation Museum	High automation and campaign ops; low data, CRM, routing	Lots of sequences running on an untrusted record.
The Reporting Island	High reporting and attribution; low routing and response	You can see the leak precisely and still not have fixed it.
The AI Experiment	High AI; low governance, measurement and integrations	Impressive output, no baseline, no rollback.
The Solid Base	High foundations; mid everything else	The right place to be. Invest in orchestration next.

Priority matrix

Plot each low-scoring dimension by impact on pipeline and effort to fix. The sequence below is the one that usually holds.

Priority	Dimensions	Why first	Window
P1	Data, CRM, routing	Everything downstream inherits these; response time converts.	30 days
P2	Lifecycle, scoring, enrichment	Turns capture into qualified, routed demand.	60 days
P3	Automation, integrations, reporting	Makes the system reliable and observable.	60-90 days

Priority	Dimensions	Why first	Window
P4	Attribution, AI, governance	Worth doing once the inputs are trustworthy.	90 days+

A maturity score is only useful if it changes what you do next quarter. If your priorities are the same after the assessment as before it, the assessment measured nothing.
